(54) Title: VACCINES AGAINST HEPATITIS C

(57) Abstract

A vaccine composition comprises QS21,3 De-O-acylated monophosphoryl lipid A (3D-MPL), an oil in water emulsion, wherein the oil in water emulsion has the following composition: a metabolisible oil, such as squalene, alpha tocopherol and tween 80, and at least one immunogen selected from the group consisting of (a) a hepatitis C virus core protein or an immunogenic derivative thereof, and (b) a hepatitis C virus envelope protein or an immunogenic derivative thereof.

#### VACCINES AGAINST HEPATITIS C

The present invention relates to novel vaccine formulations, to methods of their production and to their use in medicine.

3 De-O-acylated monophosphoryl lipid A is known from GB2 220 211 (Ribi). Chemically it is a mixture of 3 De-O-acylated monophosphoryl lipid A with 4, 5 or 6 acylated chains and is manufactured by Ribi Immunochem Montana. A preferred form of 3 De-O-acylated monophosphoryl lipid A is disclosed in International Patent Application No. 92/116556.

QS21 is a Hplc purified non toxic fraction of a saponin from the bark of the South American tree Quillaja Saponaria Molina and its method of its production is disclosed (as QA21) in US patent No. 5,057,540.

Oil in water emulsions per se are known in the art, and have been suggested to be useful as adjuvant compositions (EPO 399843).

Hepatitis C virus is described in EP-A-0 318 216. A particular antigenic protein of hepatitis C virus has been designated the core protein and is described by, for example, Delisse et al., J. Hepatology, 1991;13 (Suppl. 4): S20-S23 (for genotype 1b). Particular envelope proteins of hepatitis C virus have been designated E1 and E2 and are described by, for example, Grakoui et al., 1993, J. Virology 67, 1385-1395; Spacte et al., 1992, Virology 188, 819-830; Matsumia et al., J. Virology 66, 1425-1431, and Kohara et al., 1992, J. Gen. Virol. 73, 2313-2318. A majority of the HCV genotypes identified to date are described by Okamoto Hiroaki and Mishiro Shunji, Intervirology, 1994, 37: 68 et seq.

The present invention provides a vaccine composition comprising QS21, 3 De-O-acylated monophosphoryl lipid A (3D-MPL), an oil in water emulsion, wherein the oil in water emulsion has the following composition: a metabolisible oil, such as squalene, alpha tocopherol and tween 80, and at least one immunogen selected from the group consisting of (a) a hepatitis C virus core protein or an immunogenic derivative thereof, and (b) a hepatitis C virus envelope protein or an immunogenic derivative thereof.

The term "immunogenic derivative" encompasses any molecule such as a truncated or other derivative of the protein which retains the ability to induce an immune response to the protein following internal administration to a human. Such other derivatives can be prepared by the addition, deletion, substitution, or rearrangement of amino acids or by chemical modifications thereof.

Immunogenic fragments of the protein, which may be useful in the preparation of subunit vaccines, may be prepared by expression of the

10

15

20

25

30

35

appropriate gene fragments or by peptide synthesis, for example using the Merrifield synthesis (The Peptides, Vol 2., Academic Press, NY, page 3).

The immunogenic derivative of the invention can be a hybrid, that is, a fusion polypeptide containing additional sequences which can carry one or more epitopes for other immunogens. Alternatively, the immunogenic derivative of the invention can be fused to a carrier polypeptide or to another carrier which has immunostimulating properties, as in the case of an adjuvant, or which otherwise enhances the immune response to the protein or derivative thereof, or which is useful in expressing, purifying or formulating the protein or derivative thereof.

The invention also extends to the HCV protein or immunogenic derivative thereof when chemically conjugated to a macromolecule using a conventional linking agent such as glutaraldehyde (Geerlings et al, (1988) J, Immunol. Methods, 106, 239-244).

Proteins and their immunogenic derivatives suitable for use in the present invention can be prepared by expressing DNA encoding said protein or derivative thereof in a recombinant host cell and recovering the product, and thereafter, optionally, preparing a derivative thereof.

A DNA molecule comprising such coding sequence can be synthesized by standard DNA synthesis techniques, such as by enzymatic ligation as described by D.M. Roberts et al in Biochemistry 1985, 24, 5090-5098, by chemical synthesis, by in vitro enzymatic polymerization, or by a combination of these techniques.

Enzymatic polymerisation of DNA may be carried out in vitro using a DNA polymerase such as DNA polymerase I (Klenow fragment) in an appropriate buffer containing the nucleoside triphosphates dATP, dCTP, dGTP and dTTP as required at a temperature of 10°-37°C, generally in a volume of 50ml or less. Enzymatic ligation of DNA fragments may be carried out using a DNA ligase such as T4 DNA ligase in an appropriate buffer, such as 0.05M Tris (pH 7.4), 0.01M MgCl<sub>2</sub>, 0.01M dithiothreitol, 1mM spermidine, 1mM ATP and 0.1mg/ml bovine serum albumin, at a temperature of 4°C to ambient, generally in a volume of 50ml or less. The chemical synthesis of the DNA polymer or fragments may be carried out by conventional phosphotriester, phosphite or phosphoramidite chemistry, using solid phase techniques such as those described in 'Chemical and Enzymatic Synthesis of Gene Fragments - A Laboratory Manual' (ed. H.G. Gassen and

20

25

30

A. Lang), Verlag Chemie, Weinheim (1982),or in other scientific publications, for example M.J. Gait, H.W.D. Matthes, M. Singh, B.S. Sproat, and R.C. Titmas, Nucleic Acids Research, 1982, 10, 6243; B.S. Sproat and W. Bannwarth, Tetrahedron Letters, 1983, 24, 5771; M.D. Matteucci and M.H Caruthers, Tetrahedron Letters, 1980, 21, 719; M.D. Matteucci and M.H. Caruthers, Journal of the American Chemical Society, 1981, 103, 3185; S.P. Adams et al., Journal of the American Chemical Society, 1983, 105, 661; N.D. Sinha, J. Biernat, J. McMannus, and H. Koester, Nucleic Acids Research, 1984, 12, 4539; and H.W.D. Matthes et al., EMBO Journal, 1984, 3, 801.

DNA polymers which encode mutants may be prepared by site-directed mutagenesis by conventional methods such as those described by G. Winter et al in Nature 1982, 299, 756-758 or by Zoller and Smith 1982; Nucl. Acids Res., 10, 6487-6500, or deletion mutagenesis such as described by Chan and Smith in Nucl. Acids Res., 1984, 12, 2407-2419 or by G. Winter et al in Biochem. Soc. Trans., 1984, 12, 224-225.

Recombinant techniques are described in Maniatis et. al., Molecular Cloning - A Laboratory Manual; Cold Spring Harbor, 1982-1989.

In particular, a protein or immunogenic derivative for use in the present invention can be prepared using the following steps:

- i) preparing a replicable or integrating expression vector capable, in a host cell, of expressing a DNA polymer comprising a nucleotide sequence that encodes said protein or an immunogenic derivative thereof;
- i) transforming a host cell with said vector;
- iii) culturing said transformed host cell under conditions permitting expression of said DNA polymer to produce said protein; and
- iv) recovering said protein.

The term 'transforming' is used herein to mean the introduction of foreign DNA into a host cell by transformation, transfection or infection with an appropriate plasmid or viral vector using e.g. conventional techniques as described in Genetic Engineering; Eds. S.M. Kingsman and A.J. Kingsman;

Blackwell Scientific Publications; Oxford, England, 1988. The term 'transformed' or 'transformant' will hereafter apply to the resulting host cell containing and expressing the foreign gene of interest.

The replicable expression vector may be prepared by cleaving a vector compatible with the host cell to provide a linear DNA segment having an intact replicon, and combining said linear segment with one or more DNA molecules which, together with said linear segment encode the desired product, under ligating conditions.

Thus, the DNA polymer may be preformed or formed during the construction of the vector, as desired.

The choice of vector will be determined in part by the host cell, which may be prokaryotic or eukaryotic. Suitable vectors include plasmids, bacteriophages, cosmids and recombinant viruses.

The preparation of the replicable expression vector may be carried out conventionally with appropriate enzymes for restriction, polymerisation and ligation of the DNA, by procedures described in, for example, Maniatis et al cited above.

The recombinant host cell is prepared by transforming a host cell with a replicable expression vector under transforming conditions. Suitable transforming conditions are conventional and are described in, for example, Maniatis et al cited above, or "DNA Cloning" Vol. II, D.M. Glover ed., IRL Press Ltd, 1985.

The choice of transforming conditions is determined by the host cell. Thus, a bacterial host such as <u>E</u>. <u>coli</u> may be treated with a solution of CaCl<sub>2</sub> (Cohen <u>et al</u>, Proc. Nat. Acad. Sci., 1973, <u>69</u>, 2110) or with a solution comprising a mixture of RbCl, MnCl<sub>2</sub>, potassium acetate and glycerol, and then with 3-[N-morpholino]-propane-sulphonic acid, RbCl and glycerol. Mammalian cells in culture may be transformed by calcium co-precipitation of the vector DNA onto the cells.

Culturing the transformed host cell under conditions permitting expression of the DNA polymer is carried out conventionally, as described in, for example, Maniatis et al and "DNA Cloning" cited above. Thus, preferably the cell is supplied with nutrient and cultured at a temperature below 45°C.

The product is recovered by conventional methods according to the host cell. Thus, where the host cell is bacterial, such as E. coli it may be

5

10

15

20

25

30

10

15

lysed physically, chemically or enzymatically and the protein product isolated from the resulting lysate. Where the host cell is mammalian, the product may generally be isolated from the nutrient medium or from cell free extracts. Conventional protein isolation techniques include selective precipitation, absorption chromatography, and affinity chromatography including a monoclonal antibody affinity column.

Preferably, the host cell is E. coli.

A particular aspect of the present invention provides a novel compound which comprises an HCV core protein, or an immunogenic derivative thereof, fused to a polypeptide containing foreign epitopes. The polypeptide is preferably an influenza protein, such as the NS1 protein, or an immunogenic derivative thereof. DNA coding for such a novel compound, vectors containing said DNA, host cells transformed with said vectors, and their use in producing said novel compound, form still further aspects of the invention claimed.

The vaccines of the present invention are preferential stimulators of IgG2a production and TH1 cell response. This is advantageous, because of the known implication of TH<sub>1</sub> response in cell mediated response. Indeed in mice induction of IgG2a is correlated with such an immune response.

The vaccines of the invention enhance induction of cytolytic T lymphocyte responses. Induction of CTL is easily seen when the target antigen is synthesised intracellularly, ie during infection by the virus, because peptides generated by proteolytic breakdown of the antigen can enter the appropriate processing pathway, leading to presentation in association with class I molecules on the cell membrane.

However, in general, pre-formed soluble antigen does not reach this processing and presentation pathway, and does not elicit class I restricted CTL. Therefore conventional non-living vaccines, while eliciting antibody and T helper responses, do not generally induce CTL mediated immunity. The combination of the two adjuvants QS21 and 3D-MPL together with an oil in water emulsion can overcome this serious limitation of vaccines based on recombinant proteins, and induce a wider spectrum of immune responses.

In certain systems, the combination of 3D-MPL and QS21 together with an oil in water emulsion have been able to synergistically enhance interferon  $\gamma$  production.

Additionally the oil in water emulsion may contain span 85 and/or lecithin. A preferred form of 3 De-O-acylated monophosphoryl lipid A is disclosed in International patent application published under No. 92116556 - SmithKline Beecham Biologicals s.a.

10

15

20

25

30

The oil in water emulsion may be utilised on its own or with other adjuvants or immuno-stimulants

In a further aspect of the present invention there is provided a vaccine as herein described for use in medicine.

The ratio of QS21: 3D-MPL will typically be in the order of 1: 10 to 10: 1; preferably 1: 5 to 5: 1 and often substantially 1: 1. The preferred range for optimal synergy is 2.5:1 to 1:1 3D MPL: QS21. Typically for human administration QS21 and 3D MPL will be present in a vaccine in the range 1  $\mu$ g - 100  $\mu$ g, preferably 10  $\mu$ g - 50  $\mu$ g per dose. Typically the oil in water will comprise from 2 to 10% squalene, from 2 to 10% alpha tocopherol and from 0.3 to 3% tween 80. Preferably the ratio of squalene: alpha tocopherol is equal or less than 1 as this provides a more stable emulsion. Span 85 may also be present at a level of 1%. In some cases it may be advantageous that the vaccines of the present invention will further contain a stabiliser.

Vaccine preparation is generally described in New Trends and Developments in Vaccines, edited by Voller et al., University Park Press, Baltimore, Maryland, U.S.A. 1978. Encapsulation within liposomes is described, for example, by Fullerton, U.S. Patent 4,235,877. Conjugation of proteins to macromolecules is disclosed, for example, by Likhite, U.S. Patent 4,372,945 and by Armor et al., U.S. Patent 4,474,757.

The amount of protein in each vaccine dose is selected as an amount which induces an immunoprotective response without significant, adverse side effects in typical vaccinees. Generally, it is expected that each dose will comprise 1-1000  $\mu$ g of protein, preferably 2-100  $\mu$ g. An optimal amount for a particular vaccine can be ascertained by standard studies involving observation of appropriate immune responses in subjects. Following an initial vaccination, subjects may receive one or several booster immunisation adequately spaced.

The formulations of the present invention may be used for both prophylatic and therapeutic purposes.

Accordingly in one aspect, the invention provides a method of treatment comprising administering an effective amount of a vaccine of the present invention to a patient.

The following examples illustrate the invention.

20

25

#### Example 1

# 1.1 Construction and expression of a recombinant HCV core fusion protein

Plasmid pMG81 a derivative of pMG27 (Gross et al 1985, Mol.Cell. Biol. 5: 1015) in which: (i) the 81 first codons of the NS1 coding region from influenza strain A/PR/8/34 cleaved from plasmid pAS1EH/801 (Young et al. 1983, Proc. Natl. Acad. Sci. 80: 6105) have been inserted downstream of the pL promoter and ii) the ampicillin resistance gene has been replaced by the kanamycin resistance gene from transposon Tn902, was used to express the fusion protein NS1-Core.

HCV genomic sequences of hepatitis C virus genotype 1b (Delisse et al, 1991 J. Hepathology 13, suppl. 4:S20-23) were PCR amplified and cloned into pUC12 plasmid to give plasmid TCM128-2.

The nucleotides sequences corresponding to amino acids 2-166 of the core protein were amplified from TCM128-2. During the polymerase chain reaction, NcoI and XbaI restriction sites have been generated at the 5' and 3' ends of the core sequences allowing insertion into the same sites of plasmid pMG81 to give pRIT 14129.

pRIT 14129 contains the coding sequence for the fusion protein NS1 (flu)-core(HCV) and expresses the polypeptide described in SEQ ID NO. 1. The coding sequence for the fusion protein NS1 (flu)-core(HCV) is contained in SEQ ID NO 2. SEQ ID NO 3 shows the amino acid sequence 1-1006 of HCV genome type 1a (H).

Plasmid pRIT14129 was introduced into E. coli AR 58 (Mott et al, 1985, Proc, Natl. Acad. Sci., 82:88) containing the thermosensitive repressor of the  $\lambda pL$  promoter.

The recombinant bacteria were grown in a 20 Litters fermentor under fed-batch conditions at 30°. The expression of the NS1-Core protein was induced by raising the temperature to 38-42°C. The cells were then harvested and mechanically disrupted.

# 1.2 Purification of the NS1-Core fusion protein

35 The antigen was purified in a denatured form by preparative electrophoreses:

Step 1: Bacterial cells were broken (Rannie-2 x 14,500 pi) in a 20 mM phosphate buffer pH7 containing protease inhibitors (1mM pefabloc, 0.5mg/leupeptin, 0.1% aprotinin).

8

- Step 2: Lysate was centrifuged for 25 minutes, at 17,000g. At this stage the recombinant protein was insoluble and was recovered in the pellet. The pellet was washed two times with 10mM phosphate pH6.8, 2M NaCl, 4M urea; three times with 10mM phosphate pH 6.8, 0.15M NaCl, and centrifuged at 17,000g for 25 minutes after each wash step. These steps were introduced in order to lower the endotoxin content of the purified product.
  - Step 3: The washed pellets re suspended in SDS-PAGE reducing sample buffer, boiled for 5 minutes, centrifuged again at 27,000g for 25 minutes and then applied on a 12% polyacrylamide gel for separation of the remaining proteins (Prep Cell equipment,

15 Biorad).

Step 4: The protein was electroluted from the gels in 25mM Tris pH8, 200mM glycine, 0.1% SDS; precipitated by 10% TCA at 0° and finally resuspended in 10mM phosphate pH 6.8, 150mM NaCl, 50mM sarcosyl.

20

The purified antigen appears as a doublet, in the 27-30 kD range, both bands are recognised by an anti-NS1 monoclonal antibody as well as by anti-core specific human monoclonal and rabbit polyclonal antibodies.

### 25 1.3 Adjuvantation of the NSI-Core Protein

The two adjuvant formulations were made each comprising the following oil in water emulsion component.

- SB26: 5% squalene 5% tocopherol 0.4% tween 80; the particle size was 500 nm size SB62: 5% Squalene 5% tocopherol 2.0% tween 80; the particle size was 180 nm
  - 1(a) Preparation of emulsion SB62 (2 fold concentrate)
- Tween 80 is dissolved in phosphate buffered saline (PBS) to give a 2% solution in the PBS. To provide 100 ml two fold concentrate emulsion 5g of DL alpha tocopherol and 5ml of squalene are vortexed to mix thoroughly. 90ml of PBS/Tween solution is added and mixed thoroughly. The resulting emulsion is then passed through a syringe

and finally microfluidised by using an M110S microfluidics machine. The resulting oil droplets have a size of approximately 180 nm.

1(b) Preparation of emulsion SB26

5

This emulsion was prepared in an analogous manner utilising 0.4% tween 80.

- 1(c) Other emulsions as depicted in the Table were made in an analogous manner.
- 10 1(d) Preparation of fusion protein/QS21/3D MPL/ oil in water formulation.

To the emulsion of 1 a) or b) or c) an equal volume of twice concentrated fusion protein(either 20µg or 100µg) was added and mixed. This was combined with 50µg/ml of 3D-MPL and 20µg/ml of QS21 to give the final formulation. Buffer was set according to salt content and pH.

### Example 2

### 2.1 Preparation of a recombinant E1E2 oligomeric protein

20

15

Oligomeric forms of E1-E2 HCV envelope proteins can be prepared form mammalian cells infected with recombinant vaccinia virus expressing HCV envelope sequences as a polyprotein. The coding sequences for a polyprotein covering the amino acids 167-1006 of HCV genome of type 1a (H) can be inserted in vaccinia virus vectors using procedures known in the art and the resulting plasmid used to prepared vaccinia recombinant virus that will lead to expression of the polyprotein in infected cells. The expressed polyprotein is processed and retained intracellularly. E1-E2 oligomeric form can be purified from cell extracts in which the E1/E2 protein complex has been solubilized using specific detergent (Ralston et al, 1993, J. Virology 67:6753)

(Dubuisson et al 1994, J. Virology 68:6147).

### 2.2 Preparation of vaccine formulations

Formulations of oligomeric E1E2 are prepared analogously to the formulations of Example 1.

# Example 3

Formulations containing both the fusion protein of Example 1 and the E1E2 oligomer of Example 2 are prepared analogously to the formulations of Example 1, each formulation containing between 50 and 100µg of each protein.

# Table 1

#### Claims

- 1. A vaccine composition comprising: QS21; 3 De-O-acylated monophosphoryl lipid A (3D-MPL); an oil in water emulsion, wherein the oil in water emulsion has the following composition: a metabolisible oil, alpha tocopherol and tween 80; and at least one immunogen selected from the group consisting of (a) a hepatitis C virus core protein or an immunogenic derivative thereof, and (b) a hepatitis C virus envelope protein or an immunogenic derivative thereof.
- 2. A vaccine composition according to claim 1 wherein the HCV protein or immunogenic derivative thereof is chemically conjugated to a carrier molecule.
  - 3. A vaccine composition according to claim 1 or 2 wherein the immunogenic derivative is a fusion polypeptide.
  - 4. A vaccine composition according to claim 3 wherein the fusion polypeptide comprises an HCV core protein or an immunogenic derivative thereof fused to an influenza protein or an immunogenic derivative thereof.
- 20 5. A vaccine composition according to claim 4 wherein the influenza protein is the NS1 protein.
  - 6. A compound which comprises an HCV core protein, or an immunogenic derivative thereof, fused to a polypeptide containing foreign epitopes.
  - 7. A compound according to claim 6 wherein the polypeptide containing foreign epitopes is an influenza protein or an immunogenic derivative thereof.
- 8. A compound according to claim 7 wherein the influenza protein is the NS1 protein.
  - 9. A method of treating or preventing HCV infection, which comprises administering to a patient in need thereof an effective amount of a composition according to any one of claims 1 to 5 or a compound according to any one of claims 6 to 8.

- 10. Use of a composition according to any one of claims 1 to 5 or a compound according to any one of claims 6 to 8 in the manufacture of a medicament for use in the prevention or treatment of HCV infection.
- 5 11. A process for the preparation of a composition according to any one of claims 1 to 5, which process comprises mixing the constituents thereof in the required proportions.
- 12. A process for the preparation of a compound according to any one of claims 6 to 8, which process comprises expressing DNA encoding said compound in a recombinant host cell and recovering the product.
  - 13. A DNA molecule encoding a compound according to any one of claims 6 to 8.
  - 14. A recombinant vector comprising the DNA of claim 13.
  - 15. A host cell transformed with the recombinant vector of claim 14.

### INTERNATIONAL SEARCH REPORT

emational application No.

PCT/EP 96/02764

Box I Ob	servations where certain claims were found unsearchable (Continuation of item 1 of first sheet)
This Internat	ional Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:
Rer hur a 1	ms Nos.:  9 use they relate to subject matter not required to be searched by this Authority, namely: nark: Although claim 9 is directed to a method of treatment of the nan/animal body, the search has been carried out and based on the leged effects of the compound/composition.
beca	ms tros use they relate to parts of the International Application that do not comply with the prescribed requirements to such  use they relate to parts of the International Application that do not comply with the prescribed requirements to such  use they relate to parts of the International Application that do not comply with the prescribed requirements to such  use they relate to parts of the International Application that do not comply with the prescribed requirements to such  use they relate to parts of the International Application that do not comply with the prescribed requirements to such  use they relate to parts of the International Application that do not comply with the prescribed requirements to such  use they relate to parts of the International Application that do not comply with the prescribed requirements to such  use they relate to parts of the International Application that do not comply with the prescribed requirements to such  use the prescribed requirements of the International Application that do not comply with the prescribed requirements to such  use the prescribed requirements of the International Application that  use the prescribed requirements of the International Application that  use the prescribed requirements of the International Application that  use the Internation that  use the Intern
	ms Nos.; use they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).
Box II Obs	ervations where unity of invention is lacking (Continuation of item 2 of first sheet)
This Internati	ional Searching Authority found multiple inventions in this internstional application, as follows:
1. As a searc	Il required additional search fees were timely paid by the applicant, this International Search Report covers all chable claims.
2. As a of a	Il searchable claims could be sear <del>ches</del> without effort justifying an additional fee, this Authority did not invite pay <del>me</del> nt ny additional fee.
3. As a cove	only some of the required additional search fees were timely paid by the applicant, this International Search Report rs only those claims for which fees were paid, specifically claims Nos.:
	required additional search fees were timely paid by the applicant. Consequently, this International Search Report is international Search Report is intended to the invention first mentioned in the claims; it is covered by claims Nos.:
Remark on Pr	The additional search fees were accompanied by the applicant's protest.  No protest accompanied the payment additional search fees.
